They provide Governments with the instruments and skillset to build understanding and enhance early preparation and risk reduction for local communities and nationals. In addition, Early Warning Systems and traditional knowledge are important drivers for development and innovation. We have seen a significant change in how communities respond and act once the warning messages are received. There is a big shift towards a people centred approach in development and DRR where the needs, livelihood and security of people is at the forefront. This recognises the importance and diversity of cultural and historical knowledge that had been developed and evolved over time. This, together with rapidly growing modern science, should be organised and utilised in an inclusive, coordinated, respectful and balanced platform that integrates the traditional leadership and governance structure, guided by localised knowledge of the environment and the linkages between the roles that different groups of the communities play prior to, during and post extreme climatic conditions. It is a pioneering study which aims to provide a comprehensive, interdisciplinary, multi-methodological and integrated assessment of the climate crisis and oceans covering 16 countries in the Pacific. Significant in this study is Pacific Indigenous knowledge of climate change based on centuries of knowledge production, daily experience and observation, continuous adaptation, innovative responses to disasters, development of resilient mechanisms, protection of the environment and the centrality of interconnections between the ocean, sky, land, and people. This research gives voice to Pacific Indigenous knowledge systems and how they can work in harmony with western scientific approaches. With an interdisciplinary approach, it will provide needed integrated data which is often missing from Pacific regional positions on climate change. It aims to support Pacific Island countries to be more resilient to the impacts of climate change through effective evidenced based decision making by documenting the breadth and depth of climate extremes on Pacific people, land and ocean as well as identify and share existing practices of Pacific resilience. The research will strengthen policy framing for Pacific governments as well as be useful for global negotiations to promote the unique Pacific voices and experiences, which is often subdued by the more technologically dominant countries.</p> <p>Panel: Distinguished Professor Steven Ratuva</p>
